To the Editor:

We thank Bressler and Zampella for their thoughtful comments on our article "Dermatology without Dermatologists? Analyzing Instagram influencers with dermatology-related hashtags." Given our goal to accurately identify dermatology influencers, we appreciate their concerns regarding use of follower counts. As pointed out, follower counts do not always translate to influence, as accounts may have paid for followers. We thus agree on the importance of considering objective measures of engagement. In our study, we anticipated this concern and used two definitions of influencers: one based on follower count (greater than 40,000), and a second based on capturing high engagement (number of appearances in Instagram's Top 9).

Our goal in the study was to identify accounts producing popular dermatology content. We were limited by the proprietary nature of Instagram's algorithm for Top 9 posts. However, this algorithm most likely measures engagement (likes and comments) and growth.² While one of our criteria identified accounts based on the Top 9, our second definition (based on follower counts) was meant to be an objective alternative, regardless of how these followers were obtained. We reasoned that using both criteria together would provide the best representation of the most popular influencers.

In future research, identifying influencers may be improved with new analytics. Bressler and Zampella make a compelling argument for engagement rate (ER). Following their suggestion to use SocialBlade, an ER measurement tool, we compiled engagement rates of our study's identified influencers (Table 1). SocialBlade calculates ER based on the creator's 20 most recent posts. Overall, our influencers' average ER (3.21%) matched the average ER across all public Instagram users. Accounts with more followers (lower average ER) had a larger estimated user reach compared to accounts with fewer followers (higher average ER). Further, board-certified dermatologists had a lower ER (1.87%) than other groups.

53	Despite its utility, ER also has weaknesses, e.g. users can purchase likes and comments. Future studies
54	should carefully consider the merits and faults of various metrics and discuss their limitations.
55	
56	Ultimately, no perfect or consensus metric for influencers currently exists. Still, multiple different
57	definitions (follower count, top 9 appearances, and ER) consistently demonstrated data supporting one
58	conclusion: board-certified dermatologists represent a tiny fraction of users generating the most popular
59	Instagram dermatology content. The American Academy of Dermatology and other organizations may
60	recognize the potential, investing more in Instagram, but have yet to master the new medium. One study
61	of Facebook regarding skin cancer prevention found that most messages from professional organizations
62	were didactic and focused on skin cancer risk using a strategy of fear appeal, which may prove ineffective
63	in gaining social media influence. ⁴ We encourage dermatologists and dermatology organizations to
64	engage and generate quality posts accessible to the dermatology-seeking Instagram audience. Successful
65	engagement may require different strategies, such as positive messaging, comedic meme use, hiring
66	social-media managers, and interacting with popular influencers, especially prominent figures outside the
67	traditional dermatology community with a larger reach.
